

# ***Origin of the Gravitational Force***

## ***- Derivation from the Fundamental Force -***

---

**Version-2025.10**

Publication: "The origin of the gravitational force - Derivation from the fundamental force"

<https://doi.org/10.1142/S242494242550015X>

Between energies,

**Gravitational force:** act on amounts of energy

**Fundamental force:** act on momentums (movements of energy)

Ultimate question:

Is the **gravitational force derived from the fundamental force**,

or

does it exist **independently as a law?**

## < Energy Circulation Theory (ECT) >

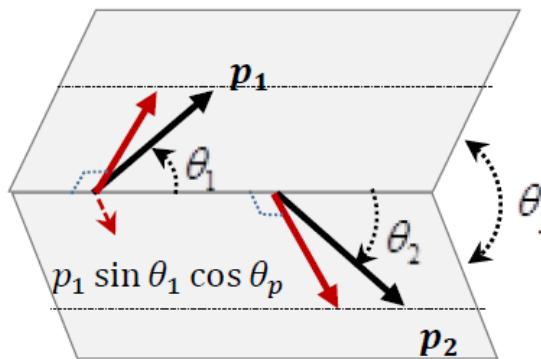

ECT: logical development from two premises

### Premises:

(1) Energy can be expressed by an intrinsic energy and its velocity.

$$E = E_1 V_1^2 = E_2 V_2^2 = mc^2$$

(2) Force works between momentums (Fundamental Force).

$$F = K_f \frac{\mathbf{r}\mathbf{p}_1 \cdot \mathbf{r}\mathbf{p}_2}{d^2} = K_f \frac{p_1 p_2}{d^2} \cos \theta_p \sin \theta_1 \sin \theta_2$$

**r****p**: orthogonal momentum to the distance  $r_p = p \sin \theta$

## Intra-circulation force: (form an energy circulation)

Between local momentums  $\Delta\mathbf{p}_0$  and  $\Delta\mathbf{p}_\theta$ : ( $\mu$ : radius) (See Fig. on p13)

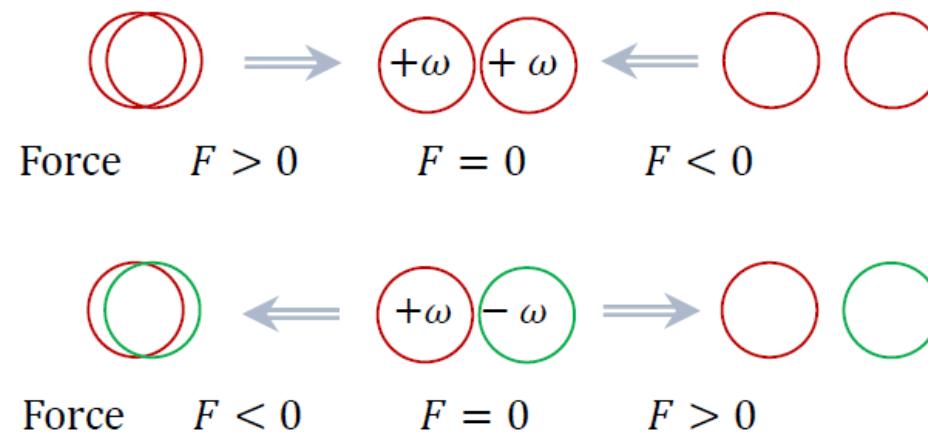

$$\Delta F = K_f \frac{\Delta p_0 \Delta p_\theta}{d^2} \sin \frac{\theta}{2} \sin \frac{-\theta}{2} = -K_f \frac{\Delta p_0 \Delta p_\theta}{4\mu^2}, \quad d = 2\mu \sin \frac{\theta}{2}$$

Centripetal force on  $\Delta\mathbf{p}_0$  from the whole circulation:

$$cF_\perp = -K_f \frac{\Delta p_0}{4\mu^2} \int_0^{2\pi} \Delta p_\theta \sin \frac{\theta}{2} d\theta = -K_f \frac{p \Delta p_0}{2\pi\mu^2}$$

## Inter-circulation force:

- (1) Orthogonal interaction
- (2) Flat interaction

## < Cosmic separation >

**Energy:** Continuum vibrating in multiple ( $M$ ) dimensions

Can be expressed in **any number** of dimensions

2D expression:  $E\psi_2 = E[X_1 \ X_2] = E\mu(\cos \omega t + i \sin \omega t) = E\mu \exp(i\omega t)$

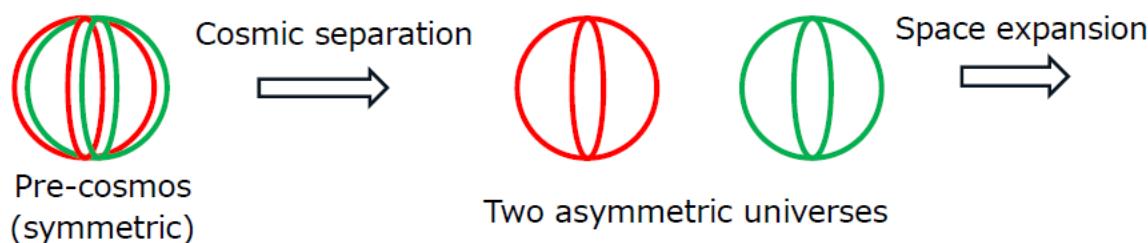

**Pre-cosmos:** Symmetric – coupled pairs of conjugate circulations

$$E_{pre}\psi_2 = E_{pre}\mu(\varphi: \varphi^*), \quad \varphi = \exp(i\omega t), \varphi^* = \exp(-i\omega t)$$

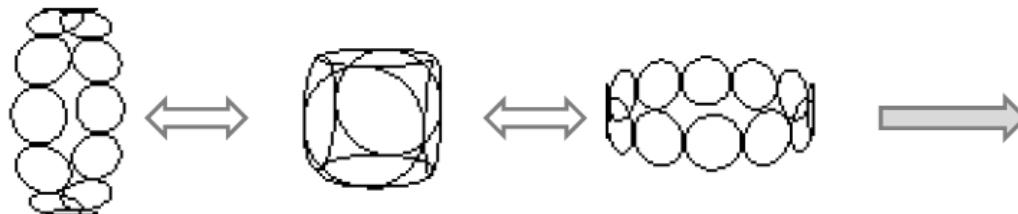

$$E_{pre}\psi_M = E_{pre}\mu(\varphi_{12}:\varphi_{12}^* + \varphi_{34}:\varphi_{34}^* + \varphi_{56}:\varphi_{56}^* \dots)$$

**Cosmic separation** to two universes:

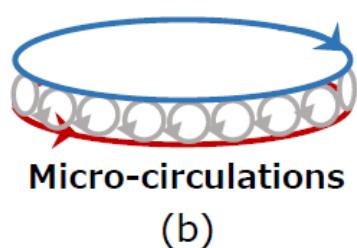

$$E\mu_{pre}(\varphi_{12}:\varphi_{12}^* + \varphi_{34}:\varphi_{34}^*) \rightarrow \frac{E}{2}\mu_u(\varphi_{12} + \varphi_{34}) + \frac{E}{2}\mu_u(\varphi_{12}^* + \varphi_{34}^*)$$

## < Orthogonal dimension of a conjugate pair of circulations >

(a) A conjugate pair in the Pre-cosmos

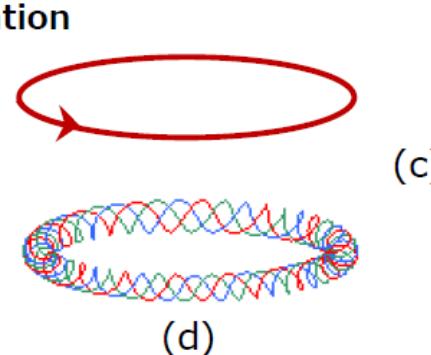

Flat separation

Micro-circulations

(b)

(c)

(d)

1D stretch in  $\mathbf{X}_1$  larger than the threshold amplitude (radius in (b)):

Orthogonal separation of conjugate pair in  $\mathbf{X}_3$ - $\mathbf{X}_4$ :  $\mathbf{X}_1$  is orthogonal

Single circulation: helical motion in  $\mathbf{X}_3$ ,  $\mathbf{X}_4$ ,  $\mathbf{X}_1$

Flat separation of conjugate pair in  $\mathbf{X}_1$ - $\mathbf{X}_2$ :  $\mathbf{X}_5$  is orthogonal

Single circulation: helical motion in  $\mathbf{X}_1$ ,  $\mathbf{X}_2$ ,  $\mathbf{X}_5$

## < Galactic evolution >

### Space expansion:

Decoupled conjugate pairs  $\rightarrow$  4 dimensions expand

$\rightarrow$  no longer can keep as a continuum

### Energy distribution just after the cosmic separation:

$$< 4D \text{ polar} > \quad \mathbf{X} = [\mu_u \quad \theta_1 \quad \theta_2 \quad \theta_3] = [\mu_u \quad \omega t \quad \theta_2 \quad \omega t]$$

$$< 4D \text{ cartesian} > \quad \mathbf{X} = \mu_u \left( \begin{array}{l} \cos \omega t + i \sin \omega t \cos \theta_2 + j \sin \omega t \sin \theta_2 \cos \omega t \\ + k \sin \omega t \sin \theta_2 \sin \omega t \end{array} \right)$$

### Energy distributed in 3D surface of a sphere in 4D:

< Take new base vectors for circulation  $\mu_u \theta_1$  >

$$\mathbf{e}_0 \equiv \cos \theta_1 + i \sin \theta_1 \text{ (radius)}$$

$$\mathbf{e}_1 \equiv \cos(\theta_1 + \pi/2) + i \sin(\theta_1 + \pi/2) = i\mathbf{e}_0 \text{ (arc)}$$

< 3D cartesian coordinates for 3D surface >

$$\mathbf{X} = \mu_u (\omega t \mathbf{e}_1 \cos \theta_2 + \sin \theta_2 (j \cos \omega t + k \sin \omega t))$$

$$= \mu_u [\omega t \cos \theta_2 \quad \sin \theta_2 \cos \omega t \quad \sin \theta_2 \sin \omega t]$$

## Space energy / Apparent energy:

Symmetric part of cosmic energy → **Space energy** (energy of vacuum space)

Asymmetric part → **Apparent energy** (observable energies)

**Spacia**: Space energy in one minimum space unit (radius  $\mu_0$ )

$$E_\mu \psi_\mu = E_\mu [X \quad H] = E_\mu \mu_0 (\exp(i\omega_0 t) + \exp(-i\omega_0 t))$$

$$v_c = \pm \mu_0 \omega_0 = \pm c, \quad E_\mu = m_\mu \mu_0^2 \omega_0^2 = m_\mu c^2$$

## Cyclic decomposition / Division of energy circulations:

Initial apparent energy → repeat cyclic decompositions → **galactic seeds** → galactic seed division/separation → release **stellar seeds** → release daughter circulations → repeat cyclic decompositions → **elementary circulations**

## Elementary single circulations; $iS$ , $S$ :

Minimum radius equal to  $\mu_0$  of spacia

$$E_{(iS)} \psi_{iS} = E_{(iS)} \mu_0 \exp(i\omega_0 t) = E_{(iS)} [X \quad H] = E_{(iS)} \mu_0 [\cos \omega_0 t \quad \sin \omega_0 t]$$

$$E_{(S)} \psi_S = E_{(S)} \mu_0 \exp(i\omega_0 t) = E_{(S)} [X \quad Y] = E_{(S)} \mu_0 [\cos \omega_0 t \quad \sin \omega_0 t]$$

$$E_{(iS)} = E_{(S)} = m_0 \mu_0^2 \omega_0^2 = m_0 c^2$$

**Particle:** defined as an energy circulation

- Can be static to the space energy.
- Keeps a constant radius determined by its energy amount.
- Interacts with another circulation to show a force (attractive / repulsive).

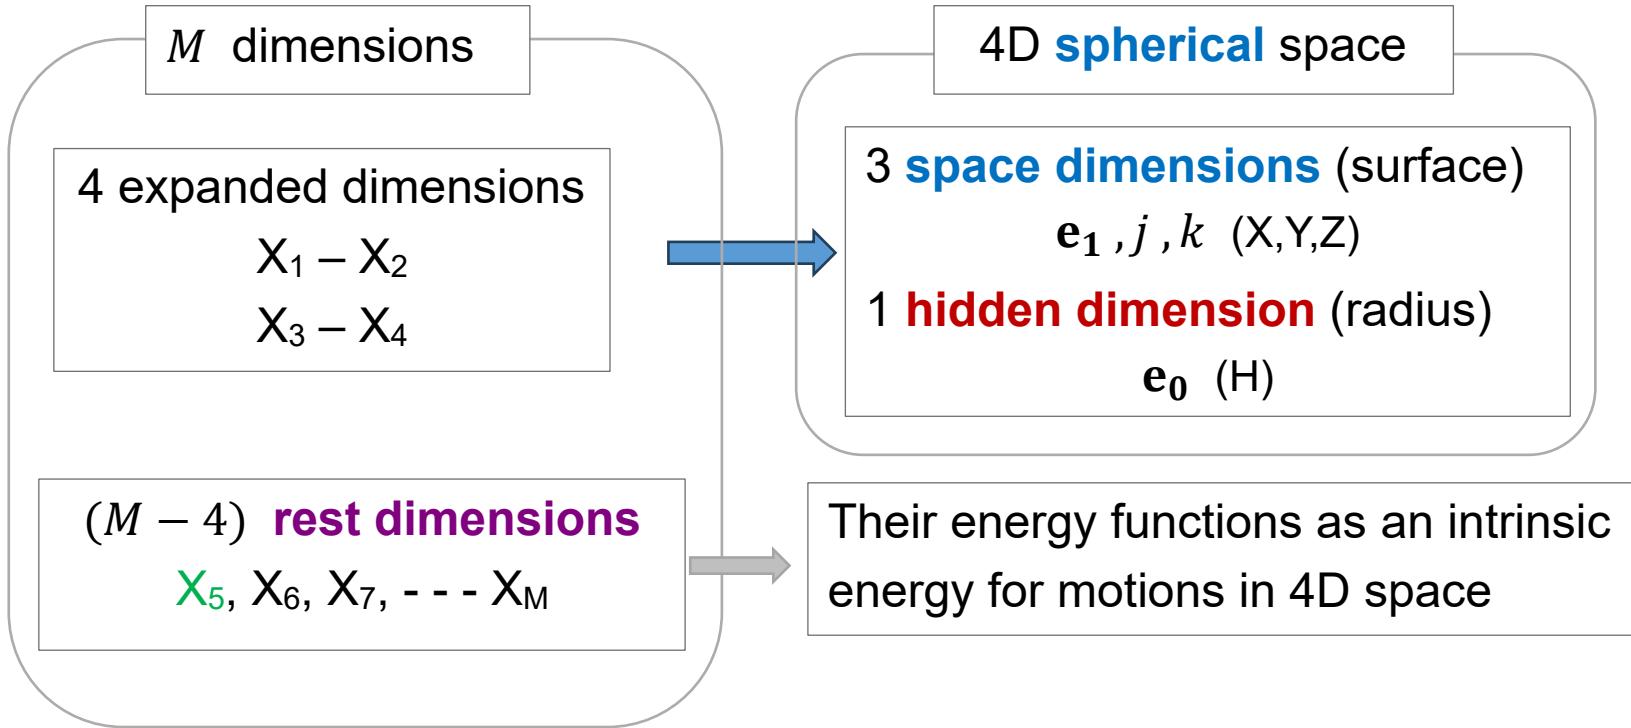

**Elementary circulations:** single or double circulations, or their excitations

$$iS, S, iD(iS: \bar{iS}), D(S: \bar{S}), iD^\#, D^\#$$

**Quantum particle:** composition of elementary circulations in a single space

Mesons, Baryons

## < Types of dimensions >

**Fifth dimension  $X_5$**  (see p5): **circular momentum**

Other rest dimensions  $X_{\text{od}}$  : **no momentum** (conjugate pair)

## < Momentums in the Fifth Dimension $X_5$ >

### (1) Just after the cosmic separation

Local intrinsic energies were helically moving on  $X_1$ - $X_2$ .

$\Delta E$ : Energy of **one cycle** of **local circulation** including  $X_5$

$$\Delta E = \Delta M(\mu_0^2 \omega_5^2 + \mu_u^2 \omega^2)$$

$\mu_u$ : Radius of main circulation (universe)  $\rightarrow$  rapidly **expand**

$\mu_0$ : Radius of local circulation including  $X_5$   $\rightarrow$  remain **constant**

**Momentum in  $X_5$**  of one local circulation:

$$\Delta p_5 = \Delta M \mu_0 \omega_5$$

**Force** between **2 halves** of circle (**linear approximation**):

$$F = K_f \frac{p_{5.1} p_{5.2}}{d^2}, \quad (\cos \theta_p \sin \theta_1 \sin \theta_2 = 1)$$

$$F_5 \approx -K_f \frac{(\Delta M \mu_0 \omega_5 / 2)^2}{(2\mu_0)^2}$$

## (2) With space expansion and galactic evolution

- ✧ Number of spaciæ increases.
- ✧ Number of local circulations including  $X_5$  increases.
- ✧ The radius remains constant as  $\mu_0$ .
- ✧ The intrinsic energy  $\Delta M$  remains constant.
- ✧ The frequency  $\omega_5$  decreases.

**Momentums in  $X_5$ :** spread, incorporated in **all intrinsic energies**

Within one **elementary single circulation**:

$$\text{Energy of the particle: } E = m_0 \mu_0^2 \omega_0^2 = m_0 c^2$$

Intrinsic energy  $m_0$  is derived from motions in the **rest dimensions**.

$$m_0 = E_5 + E_{od} = m_5 c^2 + m_{od} c^2$$

$$k \equiv (m_s + m_{od})/m_s > 1$$

$$m_5 = \frac{m_0}{k c^2}$$

$m_5$ : intrinsic energy in  $X_5$ ,  $m_{od}$ : intrinsic energy in other rest dimensions

## < Gravitational force - 1 >

**Definition of the gravitational force:**

Fundamental force acting between **momentums** in the **fifth dimension**

**Gravitational force** within an **elementary single circulation** ( $E = m_0 c^2$ ):

$$E_5 = m_5 c^2$$

$$m_5 = \frac{m_0}{k c^2}$$

Call  $E_5$  as **g-circulation**:  $m_5$  is circulating with  $\mu_0$  and  $\omega_0$  in  $X-X_5$ .

$X$ : Distance direction in 3D space

$$E_5 \psi_5 = E_5 [X \quad X_5] = E_5 \mu_0 [\cos \omega_0 t \quad \sin \omega_0 t]$$

$$E_5 = m_5 \mu_0^2 \omega_0^2 = m_5 c^2$$

We will calculate the force in  $X$  between two halves of g-circulation.

## < Fundamental force between two halves of circulation >

Divide a circulation to two halves:

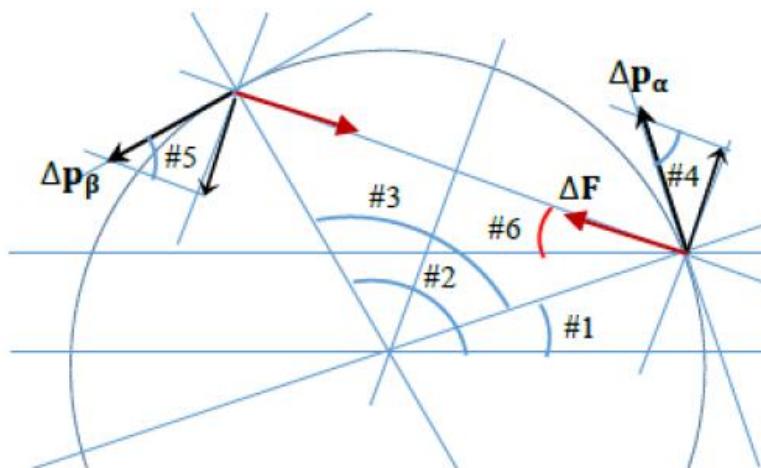

$$-\frac{\pi}{2} \leq \alpha \leq \frac{\pi}{2}, \quad \frac{\pi}{2} \leq \beta \leq \frac{3\pi}{2}, \quad \theta \equiv \beta - \alpha$$

Force between  $\Delta p_\alpha$  and  $\Delta p_\beta$ :

$$\Delta F = K_f \frac{\Delta p_\alpha \Delta p_\beta}{d^2} \sin \frac{\theta}{2} \sin \frac{-\theta}{2} = -K_f \frac{\Delta p_\alpha \Delta p_\beta}{4\mu_0^2}$$

Component in the space direction X:

$$\Delta F_x = \Delta F \cos \gamma = \Delta F \sin \frac{\alpha + \beta}{2} = \Delta F \left( \sin \frac{\alpha}{2} \cos \frac{\beta}{2} + \cos \frac{\alpha}{2} \sin \frac{\beta}{2} \right)$$

- #1:  $\alpha$
- #2:  $\beta$
- #3:  $\theta = \beta - \alpha$
- #4:  $\theta/2$
- #5:  $-\theta/2$
- #6:  $\gamma$

$$\gamma = \frac{\pi}{2} - \frac{\theta}{2} - \alpha = \frac{\pi}{2} - \frac{\alpha + \beta}{2}$$

$$d = 2\mu_0 \sin \frac{\theta}{2}$$

Force in X on  $\Delta\mathbf{p}_\alpha$  from the entire momentum  $\mathbf{p}_\pi$  in the half circle  $\pi/2 \leq \beta \leq 3\pi/2$ :

$$p_h \equiv p_\pi = \Delta p_\beta \int_{\pi/2}^{3\pi/2} d\beta = \Delta p_\beta \pi, \quad \Delta p_\beta = p_h/\pi$$

$$\begin{aligned} F_x(\alpha) &= \int_{\pi/2}^{3\pi/2} \Delta F_x \partial\beta = \int_{\pi/2}^{3\pi/2} \Delta F \left( \sin \frac{\alpha}{2} \cos \frac{\beta}{2} + \cos \frac{\alpha}{2} \sin \frac{\beta}{2} \right) \partial\beta \\ &= -K_f \frac{\Delta p_\alpha}{4\mu_0^2} \frac{p_h}{\pi} 2\sqrt{2} \cos \frac{\alpha}{2} \end{aligned}$$

**Force in X** between two **half-circle momentums**,  $\mathbf{p}_0$  and  $\mathbf{p}_\pi$ :

$$\begin{aligned} F_x &= \int_{-\pi/2}^{\pi/2} F_x(\alpha) \partial\alpha = -K_f \frac{2\sqrt{2}}{4\mu_0^2} \frac{p_h^2}{\pi^2} \int_{-\pi/2}^{\pi/2} \cos \frac{\alpha}{2} \partial\alpha \\ &= -\frac{8}{\pi^2} K_f \frac{p_h^2}{(2\mu_0)^2} \end{aligned}$$

## < Gravitational force within an elementary single circulation >

g-circulation of an elementary single circulation:

$$E_5 = m_5 \mu_0^2 \omega_0^2 = m_5 c^2, \quad m_5 = \frac{m_0}{k c^2}$$

**Half-circle momentum** of g-circulation:

$$p_h = \frac{m_5 c}{2} = \frac{m_0}{2 k c}$$

**Gravitational force** between two half-circle momentums:

$$\begin{aligned} F_x &= -\frac{8}{\pi^2} K_f \frac{(m_5 c/2)^2}{(2\mu_0)^2} = -\frac{8}{\pi^2 k^2 c^2} K_f \frac{(m_0/2)^2}{(2\mu_0)^2} \\ &= -G \frac{(m_0/2)^2}{(2\mu_0)^2} \equiv F_g \end{aligned}$$

$$G \equiv \frac{8}{\pi^2 k^2 c^2} K_f, \quad k \equiv \frac{m_s + m_{od}}{m_s} > 1$$

**Gravitational constant  $G$**  is derived.

**Electric force** between 2 halves of  $iS$ :

$$F_e = -\frac{8}{\pi^2} K_f \frac{(m_0 c/2)^2}{(2\mu_0)^2} = -K_e \frac{e^2}{(2\mu_0)^2}$$

$$K_e \equiv \frac{8}{\pi^2} K_f, \quad e \equiv \frac{1}{2} m_0 c$$

Comparison of **gravitational force** and **electric force** within the same  $iS$ .

$$F_g = -\frac{8}{\pi^2 k^2 c^2} K_f \frac{(m_0/2)^2}{(2\mu_0)^2}, \quad F_e = -\frac{8}{\pi^2} K_f \frac{(m_0 c/2)^2}{(2\mu_0)^2}$$

$$G = \frac{K_e}{k^2 c^2}, \quad k = (m_s + m_{od})/m_s > 1$$

$$F_g = \frac{F_e}{k^2 c^4} = \frac{F_e}{k^2 \times 8.1 \times 10^{33}} \approx F_e \times 10^{-34}$$

## < Gravitational force between two static quantum particles >

All intrinsic energies are connected each other by a series of g-circulations in  $X_5$ - $X$ , defined as **g-chain**.

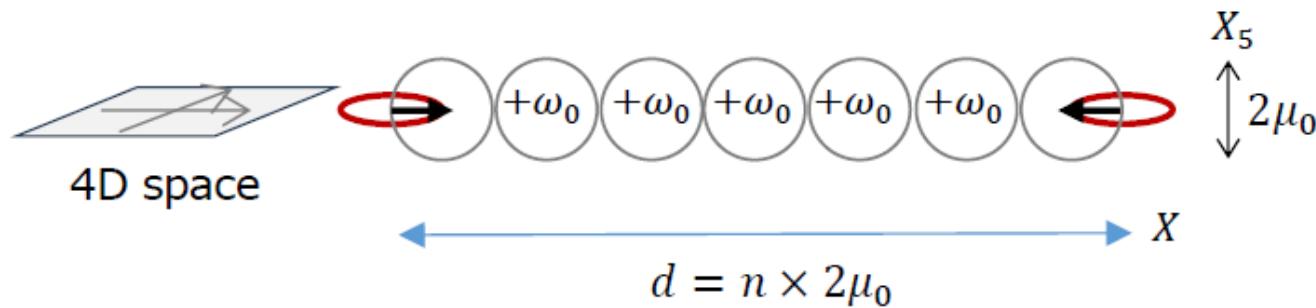

Quantum particle of  $E = mc^2$ :

$$m_5 = \frac{m}{k^2 c^2}$$

Gravitational force within a quantum particle:

$$F_g = -G \frac{(m/2)^2}{(2\mu_0)^2}$$

Gravitational force between **two** quantum particles:

**Case of  $n = 1$**  (two particles adjacent – one g-circulation):

$$m_5(n = 1) = \frac{2m}{k^2 c^2} = 2m_5, \quad E_5(n = 1) = 2m_5 c^2$$

$$F_g = -G \frac{m^2}{(2\mu_0)^2}$$

**Case of  $n \gg 1$**  (atomic scale distance  $n > 10^4$ ):

In general, **potential energy** can be defined as

$$U(x) \equiv \int_{x_0}^x (-F(x)) dx + U(x_0)$$

**Gravitational potential energy:**

Let the energy of a g-circulation for  $n = 1$  be  $U_g(2\mu_0)$ .

$$U_g(x) \equiv \int_{2\mu_0}^x (-F_g(x)) dx + U_g(2\mu_0)$$

$$U_g(2\mu_0) \equiv 2m_5 c^2$$

Practical distances greater than atomic size: We can treat  $U_g(x)$  as a **constant**.

$$U_g(x) \approx U_g(\infty) \equiv U_g$$

Between 2 particles, the g-chain consists of  $n$  g-circulations.

Energy of g-chain =  $U_g$  , Energy of one g-circulation =  $U_g/n$

$$E_5(n) = 2m_5c^2/n \text{ (in each g-circulation)}$$

Force on one particle: intra-circulation force on the **half-circle** of **one** g-circulation.

$$F_g(x) = -G \frac{(\mathbf{m}/\mathbf{n})^2}{(2\mu_0)^2} = -G \frac{m^2}{(\mathbf{n} \times 2\mu_0)^2} = -G \frac{m^2}{x^2}$$

**Gravitational force** is **inversely proportional** to the **square** of the **distance**.

Only **attractive** since it is an **intra-circulation force**.

Between **any two static quantum particles** (masses  $m_1$  and  $m_2$ ) :

$$\mathbf{F}_g(x) = -G \frac{m_1 m_2}{x^2} \mathbf{e}_d$$

Gravitational force on a particle from a **cluster of particles**:

**Sum of vectors** of individual forces

## < Gravitational force under the free motion >

**Free motion** is defined as:

that an object is **freely accelerated** by receiving a force.

The **total energy** does **not change**.

**Potential energy**: Let us define as

$$E_p(x) \equiv \int_{\infty}^x (-F(x))dx , \quad E_p(\infty) \equiv 0 \text{ (reference)}$$

For gravitational, magnetic, and inter-circulation forces.

(For electric force, we use a different reference at  $x = 2\mu_0$ .)

The reference of gravitational potential energy is changed to  $E_p(\infty) \equiv 0$ .

**Kinetic energy**:  $E_k(x) = -E_p(x)$

**Rest energy**:  $E_r(x) \equiv E_t(x) - E_k(x) = mc^2 + E_p(x)$

**Total energy**:  $E_t(x) = E_r(x) + E_k(x) = mc^2$

The potential energy is incorporated in the rest energy.

## < Helical expression >

**Liner energy:**  $E_L(x) = mv^2$

**Circular energy:**  $E_c(x) = mC_r^2 = m(c^2 - v^2)$

**Total energy:**  $E_t(x) = E_c(x) + E_L(x) = mc^2$

By receiving a force, the linear velocity  $v$  is accelerated.

## General formula for the gravitational force:

The charge for the fundamental force is the orthogonal momentum.

$$_r p = p \sin \theta$$

3D charge for the gravitational force is the **orthogonal mass**.

$$_r m = _r E / c^2 = m(1 - v^2 / c^2)$$

$$\mathbf{F}_g(x) = -G \frac{r m_1 \ r m_2}{x^2} \mathbf{e}_d$$

**Light:**  $v = c$ ,  $_r m = 0$  in propagating direction (light speed does not change)

$v = 0$ ,  $_r m = \frac{E(\gamma)}{c^2} = \frac{m_0}{2} \frac{\omega^2}{\omega_0^2}$  in **orthogonal** direction (propagation **bends**)
